

Jan 14th Assignment – Redbook Project

Student: Jack Wulanbatu

Course: Chuwa 2025.12.8 Backend Java

Date: Jan 16th, 2026

Hands-on Tasks

1. Cloned the redbook repository (02_POST_RUD branch) and imported it into IntelliJ as a Maven project.
2. Updated database configuration to connect to local MySQL.
3. Ran Maven build successfully.
4. Started Spring Boot application successfully.
5. Used Postman to create a post record in the database.

Build Success

Questions

Q1. Did you create the POSTS table in the database? If not, who did it for you? Can you change this behavior?

The POSTS table was not manually created. It was automatically generated by Hibernate when the

application started. This behavior is controlled by the property *spring.jpa.hibernate.ddl-auto*. By changing its value (such as create, update, validate, or none), we can control how Hibernate handles database schema generation.

Q2. Is the id in the database the same as what you set in your request? Why does this happen?

The id in the database is not the same as the one sent in the request. This is because the id field uses automatic generation with JPA annotations such as `@GeneratedValue`. The database is responsible for generating unique primary key values when a new record is inserted.
